AX Audit Report

for all of your ApplicationXtender audit needs...

Challenges

The management and auditing of your ApplicationXtender content management system plays a crucial part in achieving application success throughout your organization. Because ApplicationXtender can create an abundance of data, the amount of resources and time it takes to extract the data metrics, and then populate it into a user-friendly report can hinder the ability to make important critical system and end-user functionality decisions.

AX Audit Report Solution

The AX Audit Report software seamlessly plugs into your ApplicationXtender system. It functions as a key component in a technical resource time saver. Once the AX audit report is set to run, the software will automate the capture of user system metrics, and populate them into easy to read system reports. With the AX Audit Report module you can customize your reports to include the following, but are not limited to;

Concurrent License
Allocation and Usage

Scan Operator Totals

End- User Actions
and Functionality

Scan Batch History and
Indexing

Saved System Queries

New Documents Added
to your System
