

Automated Capture of Files From Many Sources

Challenges

Most content management and document imaging systems are built to capture scanned documents and electronic files that reside either in paper, a network, or a computer. Unfortunately, there are other types of files that organizations rely on to help run their businesses. These files are created both from internal and external sources. Without being able to manage and attach them to your existing system, companies are losing valuable time, and have complicated their daily business processes. These files are originating from fax machines, FTP sites, and multi-function devices.

File Bridge Solution

File Bridge offers a middleware solution that automates the capture and delivery of files originating from office fax machines, multifunction devices, and FTP sites. As faxes and files are created in their server directory, File Bridge will watch these directories for new files, convert them to a TIFF image, and release them into Kofax Ascent Capture. Once in Kofax, the files can be indexed for your content management system by Zonal OCR, Forms Recognition, Barcodes, or other semi, and fully automated processes that make up the Kofax Ascent product.
